Materials and Methods.

Unless stated otherwise, reactions were performed in flame-dried glassware under an argon or nitrogen atmosphere using dry, deoxygenated solvents (distilled or passed over a column of activated alumina). 2-(trimethylsilyl)phenyl triflate was purchased from Sigma-Aldrich Chemical Company and used as received. Tetrabutylammonium triphenyldifluorosilicate (TBAT) was purchased from Sigma-Aldrich Chemical Company and azeotropically dried three times from acetonitrile prior to use. Brine solutions are saturated aqueous sodium chloride solutions. Known dehydroamino ester starting materials were prepared by the methods of Kobayashi\textsuperscript{1} or Parsons\textsuperscript{2} unless otherwise specified. 3-methoxy-2-(trimethylsilyl)phenyl triflate,\textsuperscript{3} 4-methyl-2-(trimethylsilyl)phenyl triflate,\textsuperscript{4} 4,5-dimethoxy-2-(trimethylsilyl)phenyl triflate (4),\textsuperscript{5} 6-(trimethylsilyl)benzo[d][1,3]dioxol-5-yl triflate\textsuperscript{6} and 4,5-difluoro-2-(trimethylsilyl)phenyl triflate\textsuperscript{7} were prepared according to literature procedures. Reaction temperatures were controlled by an IKAmag temperature modulator. Thin-layer chromatography (TLC) was performed using E. Merck silica gel 60 F254 precoated plates (0.25 mm) and visualized by UV fluorescence quenching, potassium permanganate, or CAM staining. SiliaFlash P60 Academic Silica gel (particle size 0.040-0.063 mm) was used for flash chromatography. \textsuperscript{1}H and \textsuperscript{13}C NMR spectra were recorded on a Varian Mercury 300 (at 300 MHz and 75 MHz, respectively) or a Varian Inova 500 (at 500 MHz and 125 MHz, respectively), with usage specified in each case, and are reported relative to Me$_4$Si (δ 0.0). Data for \textsuperscript{1}H NMR spectra are reported as follows: chemical shift (δ ppm) (multiplicity, coupling constant (Hz), integration). Data for \textsuperscript{13}C NMR spectra are reported in terms of chemical shift relative to Me$_4$Si (δ 0.0). IR spectra were recorded on a Perkin Elmer Paragon 1000 Spectrometer and are reported in frequency of absorption (cm$^{-1}$). High resolution mass spectra were obtained from the Caltech Mass Spectral Facility.

**General Procedures**

**Method A:**
To a solution of TBAT (0.756 g, 1.40 mmol, 2.0 equiv) and amido acrylate (0.10 g, 0.70 mmol) in THF (35 mL) was added silyl aryl triflate (0.340 mL, 1.40 mmol, 2.0 equiv) dropwise via syringe. The reaction was stirred under nitrogen at ambient temperature for 6 hours, at which point the reaction was concentrated under reduced pressure and purified via flash chromatography.

**Method B:**
To a solution of TBAT (0.756 g, 1.40 mmol, 2.0 equiv) and amido acrylate (0.10 g, 0.70 mmol) in THF (70 mL) was added silyl aryl triflate (0.340 mL, 1.40 mmol, 2.0 equiv) dropwise via syringe. The reaction was stirred under nitrogen at ambient temperature for 6 hours, at which point the reaction was concentrated under reduced pressure and purified via flash chromatography.

Methyl (3,4-dimethoxyphenyl)acetamidoacrylate (3)

Oxalyl chloride (2.6 mL, 29.8 mmol, 2.3 equiv) was slowly added to a solution of acid 1 (5.55 g, 28.3 mmol, 2.2 equiv) in CH\(_2\)Cl\(_2\) (40 mL), followed by DMF (0.10 mL, 1.29 mmol, 0.1 equiv). The solution was stirred at ambient temperature for 40 min, during which time it bubbled vigorously and the color changed from pale to bright yellow. In a separate flask, serine methyl ester-HCl (2.02 g, 13.0 mmol) was suspended in CH\(_2\)Cl\(_2\) (120 mL), and Et\(_3\)N (5.91 mL, 42.0 mmol, 3.2 equiv) and DMAP (77.6 mg, 0.64 mmol, 0.05 equiv) were added.
