I. Materials and Methods

Unless noted in the specific procedure, reactions were performed in flame-dried glassware under argon atmosphere. All metathesis reactions were carried out under air-free conditions in dry glassware in a Vacuum Atmospheres Glovebox filled with N\textsubscript{2}. General solvents were purified by passing through solvent purification columns. Commercially available substrates were used as received. All solvents and substrates were sparged with Ar before bringing into the glovebox and filtered over basic alumina (Brockmann I) prior to use. Reaction progress was monitored by thin-layer chromatography (TLC) using E. Merck silica gel 60 F\textsubscript{254} precoated plates (0.25 mm) and visualized by UV fluorescence quenching, potassium permanganate, or \textit{p}-anisaldehyde staining. Silicycle SiliaFlash P60 Academic Silica gel (particle size 0.040-0.063 mm) was used for flash chromatography. Analytical chiral HPLC was performed with an Agilent 1100 Series HPLC utilizing Chiralcel OD-H and OJ-H columns (4.6 mm x 25 cm) obtained from Daicel Chemical Industries, Ltd. with visualization at 254 nm. Analytical SFC was performed with a Mettler SFC supercritical CO\textsubscript{2} analytical chromatography system utilizing Chiralcel OD-H column (4.6 mm x 25 cm) obtained from Daicel Chemical Industries, Ltd. with visualization at 210 nm. GC conversion data was obtained using an HP-5 capillary column with an Agilent 6850 FID gas chromatograph. \textsuperscript{1}H and \textsuperscript{13}C NMR spectra were recorded on a Varian Inova 500 spectrometer (500 MHz and 126 MHz, respectively), a Bruker AV III HD spectrometer equipped with a Prodigy liquid nitrogen temperature cryoprobe (400 MHz and 101 MHz, respectively), or a Varian Mercury 300 spectrometer (300 MHz and 75 MHz, respectively) and are reported in terms of chemical shift relative to residual CHCl\textsubscript{3} (\textdelta 7.26 and \textdelta 77.16 ppm, respectively). Data for \textsuperscript{1}H NMR spectra are reported as follows: chemical shift (\textdelta ppm) (multiplicity, coupling constant (Hz), integration). Abbreviations are used as follows: s = singlet, bs = broad singlet, d = doublet, t = triplet, q = quartet, quint = quintet, m = complex multiplet. Infrared (IR) spectra were recorded on a Perkin Elmer Paragon 1000 spectrometer using neat samples on ATR diamond, and are reported in frequency of absorption (cm\textsuperscript{-1}). High-resolution mass spectra HRMS were acquired from the Caltech Mass Spectral Facility using fast-atom bombardment (FAB\textsuperscript{+}), electrospray ionization (TOF ES\textsuperscript{+}) or electron impact (EI\textsuperscript{+}), and an Agilent 6200 Series TOF with an Agilent G1978A Multimode source in electrospray ionization (ESI), atmospheric pressure chemical ionization (APCI), or mixed (MM) ionization mode. Optical rotations were measured on a Jasco P-2000 polarimeter using a 100 mm pathlength cell at 589 nm.
II. Experimental Procedures and Characterization Data

1. Preparation of (±)-6:

Racemic enone (±)-5 was obtained from photooxygenation of dicyclopentadiene catalyzed by tetraphenylporphyrin (TPP) according to Mihelich and Eickhoff’s procedure.\(^1\) In a 500 mL round bottom flask, (±)-5 (13.2 g, 8.9 mmol) was dissolved in anhydrous toluene (150 mL) under argon atmosphere. The solution was cooled to \(-78 \, ^\circ\text{C}\), and a solution of DIBAL-H (1.0 M solution in toluene, 13.4 mL, 13.4 mmol, 1.5 equiv) was added dropwise. After 1.5 h, MeOH (50 mL) was added (dropwise at beginning to avoid splashing). The reaction mixture was warmed to ambient temperature, poured into a saturated Na-K tartrate solution (150 mL), and the biphasic solution was stirred overnight. The aqueous phase was extracted with CH\(_2\)Cl\(_2\) (3 × 200 mL). The combined organic phases were dried with anhydrous magnesium sulfate, filtered, and concentrated under reduced pressure. Purification by flash column chromatography on silica gel (SiO\(_2\), 10:1 to 4:1 hexanes/EtOAc) afforded compound (±)-6 as a white solid (10.9 g, 81% yield).

Lipase PS (10% on celite, 480 mg, 10 wt%) was added to the flask. The flask was sealed with a septum and kept under argon atmosphere, and placed in 37 \(^\circ\text{C}\) oil bath. (+)-6 (2.00 g, 13.5 mmol) and NMO (3.16 g, 27 mmol, 2 equiv) were added and dissolved in MeCN (3 mL) and CH\(_2\)Cl\(_2\) (27 mL). An oven-dried, 200 mL round-bottomed flask was charged with alcohol (+)-6 (2.01 g, 13.6 mmol, 1.0 equiv) and anhydrous MeCN (100 mL). The solution was vigorously stirred (>700 rpm) open to air while being treated with MeO bpy (147 mg, 0.68 mmol, 0.05 equiv), Cu(MeCN)\(_4\)OTf (256 mg, 0.68 mmol, 0.05 equiv), ABNO (0.04 M in MeCN, 3.4 mL, 135.6 \(\mu\)mol, 0.01 equiv), and then NMI (110 \(\mu\)L, 1.36 mmol, 0.10 equiv) via microsyringe. The resulting brick-red reaction mixture was vigorously stirred and exposed to air at ambient temperature until the reaction mixture turned blue-green in an hour, at which point TLC analysis indicated the complete consumption of starting material. The reaction mixture was diluted with Et\(_2\)O (50 mL), and filtered through Celite, washing with 50% EtOAc/hexanes. The filtrate was concentrated \textit{in vacuo} and the crude residue was directly purified by flash chromatography (SiO\(_2\), 4:1 hexenes/EtOAc) to afford (–)-5 (1.92 g, 97% yield) as a white solid.

5. Preparation of (+)- and (−)-8:

A 250 mL flask was charged with CuI (2.56 g, 13.44 mmol, 1.2 equiv) and flame-dried under vacuum. After cooling to room temperature, anhydrous THF (100 mL) and Me2S (5 mL) were added, and the solution was vigorously stirred for 5 minutes at room temperature until a yellow homogeneous solution was formed. At −78 °C, allylmagnesium bromide (12.3 mL, 1.0 M solution in THF, 12.3 mmol, 1.1 equiv) was added slowly. The reaction mixture was stirred at −78 °C for 1 hour and a solution of (+)-5 (1.637 g, 11.2 mmol, 1.0 equiv) in THF (5 mL) was added slowly. After 30 minutes stirring at the same temperature, a solution of trans-2-octenal (2.826 g, 22.4 mmol, 2.0 equiv) in THF (3 mL) was added slowly. The reaction was stirred for additional 1 hour at −78 °C, and a solution of saturated NH4Cl and NH3•H2O (100 mL, 9:1 NH4Cl/NH3•H2O) was added. The biphasic solution was warmed to room temperature and was vigorously stirred until a homogeneous dark blue solution was formed in the aqueous phase. The phases were separated and the organic phase was washed with 20 mL saturated NH4Cl solution. The combined aqueous phase was extracted with Et2O (3 × 100 mL). The combined organic phase was dried with anhydrous magnesium sulfate, and was concentrated in vacuo. The residue was purified by flash chromatography (SiO2, hexanes/EtOAc 15:1) to give a mixture of diastereomers of the aldol products (3.6 g).

A portion of the reaction mixture was taken out and the major diastereomer was isolated as follow:

\[ \text{Ru-1 (1 mol %)} \]

\[ \text{toluene, 23 °C, 2 torr} \]

\[ \text{then (+)-9, Ru-1 (5 mol %)} \]

In a nitrogen-filled glovebox, cis-5-octen-1-ol (205 mg, 1.6 mmol, 8.0 equiv) was dissolved in toluene (2 mL) in a 50 mL Schlenk flask and a solution of catalyst Ru-1 (13.5 mg, 16 µmol, 1 mol%) in THF (0.8 mL) was added. The Schlenk flask was sealed and brought out of the glovebox, and then connected to high vacuum. The valve was gradually opened (Caution: open slowly and stir well to avoid splashing). After 15 minutes stirring, the flask was refilled with argon and sealed, and was brought back into the glovebox. The residue was diluted with THF (0.5 mL), and an aliquot was taken for GC analysis (conversion of the homodimerization step was >98% by GC analysis). A solution of (+)-9 (46 mg, 0.2 mmol, 1.0 equiv) in THF (0.5 mL) was added into the Schlenk flask and an additional portion of catalyst Ru-1 (8.5 mg, 10 µmol, 5 mol%) solution in THF (0.5 mL) was added. The Schlenk flask was sealed and brought out of glovebox. The reaction was stirred for 16 h at 40 ºC before being quenched with a few drops of ethyl vinyl ether. The solvent was removed under reduced pressure. The residue was purified by flash chromatography (hexanes/EtOAc 2:1) to give 10 (60 mg, 99%, >99:1 Z/E, >99% ee by chiral HPLC analysis).
